

CSA A440.2 SIMULATION REPORT

Project Name: Acro Aluminum Swing Door Thermal Simulation

Project Number: 1510-17133

Simulation Date: May 19, 2023

Report Date: May 24, 2023

Revision #: R1 – Updated material properties for the gaskets and insulation based on supplier data. Also updated models based on latest CAD models, and changed the glass and spacer type.

Product Model:

Name/Number	Type
Baywest Swing Door	Single Door
Baywest Swing Door	Double Door

GENERAL NOTES

Disclaimers

- This report shall not be reproduced, neither in part nor in full, without the approval of Layton Consulting Ltd.
- This report relates only to the fenestration products simulated and are based on the CAD files and information provided by the client. Layton Consulting Ltd. does not verify that all the provided information is current and accurate to what is installed.
- Ratings values included in this report are for submittals to an NFRC-licensed IA and are not meant to be used directly for labelling purposes. Only those options identified on a valid Certificate of Authorization (CA) by an NFRC accredited Inspection Agency (IA) are to be used for labelling purposes”.
- The Condensation Resistance results obtained from this procedure are for controlled laboratory conditions and do not include the effects of air movement through the specimen, solar radiation, and the thermal bridging that may occur due to the specific design and construction of the fenestration system opening.

Simulation Notes

- Thermal simulations were conducted in full compliance with NFRC test methods (as per ANSI/NFRC 100-2020^[E0A0] Procedure for Determining Fenestration Product U-factors).
- The Solar Heat Gain Coefficient (SHGC) and Visible Transmittance (VT) were determined following ANSI/NFRC 200-2020^[E0A0].
- Glass layers are generally taken from the latest International Glazing Database (IGDB). If custom glass types were required to be created the glass layer will be noted in the “Insulated Glazing Unit (IGU) Details” section, and additional layer details can be found in the appendix. If layers were created, OPTICS software was used and NFRC 303-2020^[E0A0] & NFRC 304-2020^[E0A0] were followed to do so.
- The IGU gas fill was assumed to be filled with Argon using the single-probe timed filling technique, to fill the air gap with 90% Argon, and 10% Air.
- Simulation was completed using NFRC approved software – THERM 7.8 and WINDOW 7.8.
- Thermal simulation models may require some minor modifications made by the simulator, relative to the provided drawings, to account for software limitations.
- Rounding is per NFRC 601, NFRC Unit and Measurement Policy.
- Unless otherwise stated, only continuous hardware was modelled.

Subject: RE: Specifications on gaskets

Hi Bill,

That is interesting info but it doesn't help my thermal modeler know what thermal resistance TPE has. Do you have any information on thermal resistance of TPE for thermal modelling?

I would still like the cad drawing as well so they can get the shape correct.

Hello Brent,

Deventer came back to us with information:

About your question:
You could give the customer the follow information

Lambda Value of the DEVENTER TPE 60 is 0,2417 W/mK
Lambda value of the DEVENTER TPE foam:0,102 W/mK

With these values a customer will be able to calculate on his construction about the thermal resistance.

Subject: Door gaskets add

Hi Daniel,

We are testing our door. We are very happy with your gasket and will make an order soon.

Can you send me the thermal transmittance of Santoprene101-80 and 101-55? Preference would be in W/m*K units. I couldn't find it on the spec sheets you provided.

DESCRIPTION

Comfort Lock HFO is Closed-Cell Medium Density Spray Polyurethane Foam Insulating material that has been tested by an independent laboratory and evaluated by the Canadian Construction Materials Centre (CCMC) 146094 and Underwriters Laboratories (UL) E8-R40685-R1.0. It complies with the CAN/ULC-S706.1.15 Standard for Thermal Insulation - Spray Applied Rigid Polyurethane Foam, Medium Density - Material Specification.*

Comfort Lock HFO must be applied by CALBER licensed installers under the application standard CAN/ULC-S706.2.

Comfort Lock HFO is a low VOC emitting material and it meets the requirements of the GREENGUARD GOLD certification.

Comfort Lock HFO can be used for residential, schools, healthcare facilities, industrial, and institutional building application where proper insulation is in need.

Comfort Lock HFO also creates a bond to almost every kind of construction material on market. It can be applied to walls, roof, rim joists, crawl space foundations and most difficult space.

Comfort Lock HFO is a spray applied, rigid polyurethane medium density foam insulation. The site sprayed foam system consists of two components, isocyanate and resin. The colour of the cured foam is *ivory blue*.

Comfort Lock HFO elements are under a UL quality audit program where UL/ULC Field Engineering staff audit material manufacturing facilities, details of the product are on file at UL/ULC and are described by Comfort Lock HFO Revision 1.

PHYSICAL PROPERTIES

Physical Properties	Result	Standard

0-1 seconds	2-3 seconds	4-5 seconds

ADDITIONAL INFORMATION

Physical Properties	Description
Liters/Gal (UV) Exposure	3 months

Do not apply. Comfort Lock HFO in excess of 50 mm (two inches) depth per pass because of the product's heating effect. Before spraying another pass, please give a cooling time of at least 30 minutes between passes for dissipation of heat after spraying a pass. The risk of spontaneous combustion and poor over spraying quality would rise if not adequate cooling time allowed.

Comfort Lock HFO is combustible. A thermal barrier must be installed as per local building code requirements.

Storage Recommendations

- The Barrel Polyol should be stored in sealed containers, to avoid absorption of water vapour
- Being in direct beam, protect the production excessive sunlight and avoid sunlight exposure
- Product should be stored in a ventilated space, away from light, water, and fire

Safety Precautions

- Direct contact with Comfort Lock HFO leads to eye and skin irritation
- Repeated inhalation of volatile gas will cause respiratory allergy/seek immediate medical treatment
- Always wear protective equipment when handling product/gases, protective goggles, protective clothing
- If exposed to eyes: immediately rinse with water for at least 15 minutes
- If inhaled: seek medical attention immediately
- If swallowed: SEEK EMERGENCY MEDICAL TREATMENT IMMEDIATELY
